## LUCKY CURVE FOUNTAIN PENS

### SPECIAL POINTS OF EXCELLENCE ON ITS CONSTRUCTION

The Most Valuable Feature Ever Invented for a Fountain Pen is the "Lucky Curve." It has done more toward bringing the Fountain Pen into general use than any other single feature in its construction. It was invented for and is used exclusively in the Parker Pen. This valuable feature alone makes the Parker "Lucky Curve" the most satisfactory and cleanest writing pen you can buy.

#### THE PEN FOR CLEAN FINGERS

In the common kind of Fountain Pens you will find, if you unscrew the Nozzle from the Barrel, that the Feeder is cut off almost coextensively with the thread end. Unscrew the Parker and you will find the feeder extending for a short distance and in the form of a curve—hence the phrase "Lucky Curve." This curved end is made so that when its face is in position it will just touch against the side of the barrel. This face also has a little slit or mouth which communicates with the main channel of the feeder. Just as soon as the Fountain is inverted, as it is when carried in the pocket, the ink passes down through the ink channel, which is a capillary channel, to the mouth of the feeder, where it is in turn delivered to the side of the barrel and by it carried along to the Reservoir, and the feed channel is quickly emptied. Consequently when the cap is next removed from the Parker Pen, the nozzle is found as Dry and Clean as when the pen was first put in the pocket. In the common and old style pens of other makes, nothing has been made to provide for the bridging of the feed channel or for the draining of the ink in the feed channel after the pen has been returned to the pocket, and which has caused so many blackened fingers and dissatisfaction in using. The feeder, as said before, in the Old Style Pens, is cut off nearly at the end of the screw, and the ink cannot return to the reservoir, because the ink channel is a capillary channel and the laws of capillary attraction are stronger in this case than those of gravity. There is a break in the ink road, with no bridge across, and unless the ink can take a jump across from the end of the feed to the bottom of the reservoir, it will still remain in the channel. If there is much difference in the temperature of the pen before it is returned to the pocket, and after it has been next to the body for a few moments, the air and ink in the barrel become warmer by several degrees, for the temperature of the ordinary room is say 70 degrees, while the temperature of the body is a little more, and consequent interior expansion. There is only one way by which this can be accomplished, and that is by the heat-expanded air pushing up the ink that has filled the feed channel to permit the air under pressure in the barrel to escape. As a result the ink, with which the channel is filled, is pushed up and spilled over the edge of the nozzle under the cap where it may be found by simply removing the cap.

The Spearhead Ink Controller is to a Fountain Pen what a governor is to a steam engine. This is another valuable and necessary feature to any perfect writing fountain pen, and is only found in the Parker Pen. Any writer familiar with the action of an overcharged polished pen will see at a glance the importance of this feature in a self-feeding pen.

Occasionally ink may be forced out of the feed channel faster than is used in writing, either by expansion of air in the reservoir or a sudden jar, or for any reason whatsoever. In the old style fountain pens, and some of the modern makes, no intelligent provision is made to control this surplus ink. Blots, smears and irritation of temper resulted, and Fountain Pens were generally condemned.

In the Parker Spearhead Ink Controller the feeder is provided with a number of little reservoirs on either side of the ink channel which act in perfect harmony with the laws laid down in physics. Each reservoir gathers up the surplus ink and holds it tenaciously until drawn up into the ink channel again by the process of writing.

The Anti-Break Cap is another point of practical superiority of the Parker Pen, showing conclusively the great care and earnest thought given to every feature of construction, however small, to make it what is, a perfect pen.

The outer bore of the cap is enlarged just enough to relieve this part of the cap of all strain, the real strain taking place on the inside, back from the open end, where the walls are made very much thicker than at the open end.

The ordinary cap is so made that the strain takes place at its edge. Any undue strain or pressure at the end, as can readily be seen, will crack the cap.

Note—Any Parker Fountain Pen can be supplied with either a Fine, Medium, Coarse or Stub Point. They can also be supplied in almost any degree of flexibility so the hand of young or old can be accurately and satisfactorily fitted.

Regular Postage 2 Cents; Registered 12 Cents

Marshall-Wells Hardware Co.

LUCKY CURVE FOUNTAIN PENS

JACK-KNIFE SAFETY

This is a new departure in Fountain Pens. There have been "Safety" Fountain Pens on the market for some time. These, however, were too complicated and awkward with so much mechanism to get out of order.

The Parker "Jack Knife" Safety Pen is free from this trouble. It is simplicity itself. In the end of the regular cap is set a secondary or safety cap, held in place by a screw thread. The Regular Cap is screwed over the Nozzle the proper distance, then by simply giving the little Safety Cap a turn the pen becomes a safety. This is accomplished by the fact that the end of the safety cap comes in contact with the end of

the Nozzle, making an ink tight joint, thus enclosing the pen in an ink tight compartment. When the Regular Cap is unscrewed the turning of the cap allows the pen point to drain out and carry back to the Reservoir all free ink in which the pen may have been immersed.

Made in a variety of sizes suitable for all purposes. They can be carried in a bag upside down or flat, or any other way with entire safety thus making them ideal pens for Ladies. Gentlemen carry them in the Pants Pocket with the Jack Knife, or flat in the Vest Pocket, as most convenient. For this reason they are not so easily lost as the ordinary Fountain Pen which must be carried in the Pocket, point upward.

(Full Size Cuts)

Fits Perfectly in a Small Pocket or Ladies' Purse

No. 20SB—Baby Size; Lucky Curve Feed; Plain Black Rubber Barrel; Length Over-all 3 3/8 in. .... Each \$2.50

A Serviceable Pen under all conditions

## LUCKY CURVE FOUNTAIN PENS

### SELF-FILLING

Leakage in Pocket Impossible; Anti-Break Cap; 14 Karat Gold Pen; Spear-Head Ink Controller; Friction Joint.

All Pens Furnished with Fine, Medium, Coarse or Stub Point; Thoroughly Tested and Fitted; Reliable and Simple; Guaranteed to be exactly as represented.

Figure 1

Figure 2

Fig. 1 represents the Self-filling Pen with the side of Barrel cut away, showing how the Mechanism is Locked when Pen is in position to write. The Ink Reservoir is a Soft Rubber Sack. To fill the Reservoir, depress, with the thumb nail, that portion of the Bar which is flush with the surface of the Barrel, then the Sack can be depressed, as shown in Fig. 2. As soon as the pressure is removed from the rubber Sack, it immediately expands and fills. Then, by giving the larger projection a slight pull, backward, it is locked, as shown in Fig. 1. These Pens are particularly attractive, making unnecessary the bother of filling, also lessening the chances of ink spotted clothing and carpets.

(Full Size Cuts)

No. 20SF—Self-Filling; Lucky Curve Feed; Plain Barrel in Black or Mottled Rubber; No. 2 Pen..... Each \$2.50

No. 23SF—Self-Filling; Lucky Curve Feed; Plain Barrel, in Black or Mottled Rubber; No. 3 Pen..... Each \$3.00
